Charter & Tele-Claude at your desk

Choose the work · follow its evidence · settle what needs you

Charter package **0.4.21**
Reviewed 3 November 2026
Installed versions vary by project.

What to say to the agent

Pick unit → Criteria → Build → Verify → Record

Owner criteria still open? Keep the unit open; surface them in the desk.

- **Start:** “Show the road and recommend the next unit.”
- **Prepare:** “Write acceptance criteria and probes; start the unit.”
- **Finish:** “Show the evidence, remaining work and Owner Desk items.”

A unit is one deliverable in `.taskets/`. Its perimeter limits edits; its probes test its criteria. A decision lives in `charter/decisions/`; rails are the project’s planned road.

Your daily pass through the desk

Open the **project’s Owner Desk invitation** for that project, or the global desk for all projects.

- **Decide:** compare the options and recommendation; give your answer.
- **Do:** inspect and run the prepared action. Prompts, passwords and logins use the owner terminal.
- **Check:** follow the setup and observe the expected result. Pass records success; unfinished observation stays open.

For a supported Charter acceptance card, **Pass also commits that specific criterion and its receipt**. A refusal keeps the ask open with the error.

A tasket id identifies work. An `oa-…` id identifies a desk ask. One tasket can need several asks; one restart can serve several taskets.

Inspect the target project

In its terminal, from the root where Charter is installed. These read state.

```
python3 .charter/bin/charter next
python3 .charter/bin/charter owner --json
python3 .charter/bin/charter unit show ID --json
python3 .charter/bin/charter config
```

Get `ID` from `next` or the tasket file. `unit show` gives its path, criteria and done blockers. The Charter source repository itself is not an installed project.

When a request says only “tick AC-10”

Reply: **“Locate the project, branch, tasket and criterion. Check existing approvals. Give me the corresponding desk item and expected result.”**

`AC-10` is a label inside one tasket. You should not have to search for its Markdown file. Missing instructions are preparation work for the agent.

Ask what was established: recorded done · probes passed · reviewed · deployed · observed in use. Each needs its own evidence.

Follow the boundary before changing anything

Charter defines and protects acceptance.
The desk delivers your confirmation.
Deployment makes that code usable.

The approval path — and where to investigate

Source criterion
unit + file + branch
→ Charter export
owner --json
→ Desk card
context + expected result
→ You confirm
the criterion is satisfied
→ Charter commit
one tick + dated receipt

Charter: wrong source, gate or export

Tele-Claude: discovery, wording, confirmation or delivery

Changed criterion / branch, dirty tasket or failed commit → request stays open. Confirmation does not run the described act or its probe.

Four layers to keep current

1 · Package checkout

Version available to install.
Changing it updates no project.

Inspect: charter-pkg status / fleet

2 · Project installation

Its own .charter/ and rules.
Upgrade on an isolated branch.

Procedure: docs/install.md

3 · User machine layer

Shared Claude skill and hook.
Linked files may be live on edit.

Inspect: charter-pkg machine status

4 · Tele-Claude live

Backend running + dashboard built.
Restart and frontend deploy differ.

Inspect: desk restart / build asks

Maintenance you can request

- “Compare installed Charter versions and prepare the needed upgrades.”
- “Housekeep this project’s taskets and Owner Desk.” This reviews their relationship; it does not perform your approvals.
- “Check what is committed, running and served before proposing a restart or deploy.”

From a checkout containing the intended Charter release:

```
python3 bin/charter-pkg status /path/to/project
python3 bin/charter-pkg fleet
python3 bin/charter-pkg machine status
```

If something does not close

Absent / unclear ask	Compare Charter’s export with the desk record; prepare missing context.
Old installation	Prepare Charter 0.4.21+ and deploy desk support. An old receipt is not replayed automatically.
Pass refused	Read the error. Refresh the source/card; resolve changed text, branch or dirty target.
Chain still waits	The package chain needs your `/resume-chain` prompt in interactive Claude Code.

Authority and useful identifiers

Keep **project + branch + tasket path/id + AC label + desk id/receipt** together when reporting a problem.

Charter `owner` reads repository obligations. **Tele-Claude** `scripts/owner` reads the desk: `list`, `show oa-ID`, `mine`. Replace `oa-ID` with the actual listed ask.

Delegate levels: strict: none; routine: eligible probe checks/upgrades; answers: also transcribes your answers; open: also eligible road/scope edits and merges. `charter delegate plan` reads eligible work. Only the owner changes the level; config and structural changes stay protected.
